

Status of the Resource Website and Annual Report

Objective: Provide a website and annual report that will highlight the status and trends of focal species populations as they relate to subbasin planning objectives.

The completion of subbasin plans and subsequent adoption of biological objectives for focal species in the respective subbasins has led to a need to develop an approach that will allow the region to comprehensively monitor the responses of the populations to management efforts. Currently, there is no website nor annual report that comprehensively reports the status of focal species populations relative to the biological objectives that were approved during subbasin planning. Although there are websites and reports that provide focal-species and region-specific data, these efforts are not comprehensive and comparisons between population status data and biological objectives from subbasin planning are not presented. In an effort to provide a centralized location from which interested parties could access the focal species data as it relates to subbasin-specific biological objectives, the CBFWA proposes to develop an interactive website and annual report. Although our primary intent is to create a website and report that provide the most current data, the website will also be designed so that viewers can view historic data as it relates to the focal species and selected focal populations.
